

Chemical Peels

Chemical peels are a method of regenerating and resurfacing the skin by inducing a controlled wound. The regenerated skin is usually smoother and less wrinkled than the old skin as it removes damaged outer layers. Benefits of chemical peels are they stimulate new skin cells for long-term health, exfoliate dead skin cells for immediate clarity, promotes younger looking skin by diminishing wrinkles while improving skin elasticity, hydration and texture.

Advanced Skin Needling (DERMAPEN4)

Medical skin needling uses multiple surgical needles that vertically pierce the skin with an automatic vibrating function. When moved across the skins surface it stimulates natural collagen reproduction, whilst allowing fine channels to be created. The channels carry up to 80% more topical nutrients, allowing for treatment delivery deep into the skins fibroblasts to feed the underlying cells. This process can help to assist in the reduction of fine lines, large pores, pigmentation, scarring & acne.
